ECONOMETRICS 1 EXERCISES 2

Regression and prediction

- 1. Let X a random variable that follows a N(0, 1) distribution.
 - (a) Find the best predictor of X^2 (in the mean square sense) based on X, and compute the variance of the corresponding prediction error.
 - (b) Find the best linear prediction of X^2 (in the mean square sense) based on X, and compute the variance of the corresponding prediction error.
 - (c) Find the best linear prediction of X (in the mean square sense) based on X^2 , and compute the variance of the corresponding prediction error.
- 2. Let *X* a random variable that follows a N(1, 4) distribution.
 - (a) Find the best prediction of X^2 (in the mean square sense) based on X, and compute the variance of the corresponding prediction error.
 - (b) Find the best linear prediction of X^2 (in the mean square sense) based on X, and compute the variance of the corresponding prediction error.
 - (c) Find the best linear prediction of X (in the mean square sense) based on X^2 , and compute the variance of the corresponding prediction error.
- 3. Let Z = (Y, X)' be a two-dimensional random vector such that

$$\mathsf{E}(Y) = E(X) = 1, \tag{1}$$

$$\mathsf{V}(Z) = \left[\begin{array}{cc} 2 & 1\\ 1 & 2 \end{array} \right]. \tag{2}$$

- (a) Build the best linear prediction of *Y* based on *X* (in the mean square sense).
- (b) Graph this linear prediction as a function of *X*.
- (c) What is the variance of the corresponding prediction error?
- (d) For X = -1, 0, 1, compute the best linear predictions of *Y*.
- 4. Let *Y*, X_1, \ldots, X_k be real random variables in L^2 , and $X = (X_1, \ldots, X_k)'$.

- (a) What is the effect of changing the mean of *Y* on the conditional variance of *Y* given *X* ? Justify your answer.
- (b) What is the effect of changing the means of *Y* and *X* on the variance of the best linear prediction *Y* based on *X* ? Justify your answer.
